

# Iris Photography

“The New Stethoscope” for Health Imaging

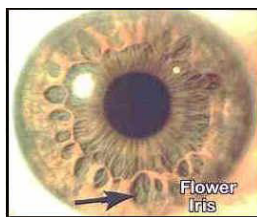

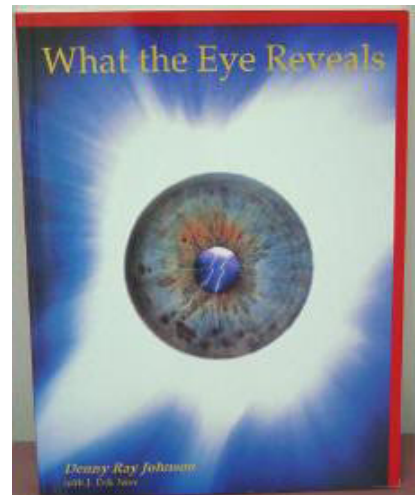

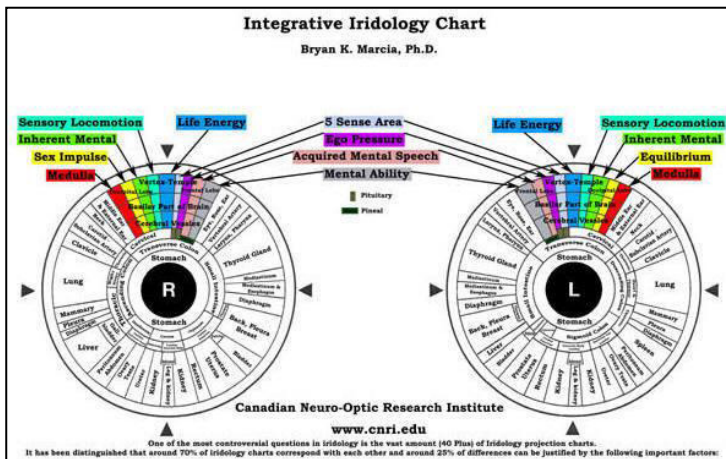

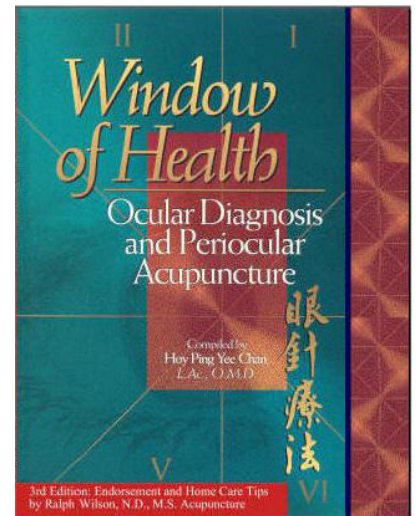

The iris structure gives clues to the structure of the body’s tissues, their functional integration, and neuro-emotional factors.

When used as part of a comprehensive integrative medicine assessment, iris photography offers a “window” on the structure and function of the body and also on the neuro-emotional tendencies of the person. The science of “microcircuits” -- a key concept in Acupuncture -- has brought new clinical assessment approaches as well new opportunities for research, both conventional and “alternative.”

***These are important times in which we live. People have new ways to learn about their strengths and challenges. Iris photos offer a wealth of information and I recommend that everyone get their eyes photographed. It is part of my standard examination.***
